Loan Workflow Automation — Audit Overview

High-level summary of how tasks and automated rules in Encompass drive a consistent, documented loan file process. Prepared October 2026.

What this is

Our loan origination system (Encompass) runs a structured workflow for every loan file. The workflow is built from two pieces that work together:

- **Tasks** — standardized work items (for example, *Review Credit*, *Send Disclosures*, *Underwrite*, *Fund Loan*). Each task has a defined checklist of **subtasks**, an assigned role, and a due date.
- **Rules** — automated triggers that watch the loan file and act on it: they create the right task at the right time, close tasks when work is finished, send required notices and disclosures, start deadline timers, and assign work to the correct role.

All task templates and rules are maintained in a version-controlled library, so every change is reviewed, dated and attributable, and can be compared against what is actually live in Encompass.

By the numbers

Component	Count	What it means
Workflow stages	7	Origination through Post-Closing QC
Task templates	85	78 built; 7 planned
Subtasks (checklist items)	290	Individual steps staff must complete inside tasks
Automated rules	192	189 active, 3 inactive
Deadline timers	14	Clocks that issue warnings or close items when time runs out

Tasks by stage

Stage	Tasks	Examples
Origination	2	File Follow Up (15 Day), File Follow Up (30 Day)
Processing	36	Review Credit, Send Disclosures, Send Disclosures (HELOC), Pull Deed
Underwriting	16	Underwrite, Title (Ownership Report), Review Appraisal, Send Appraisal
Closing	7	Confirm Scheduling, Request Closing Disclosure, Send Initial Closing Disclosure, Balance CD
Funding	8	Confirm Funding, Approve Wire, Approve Funding Figures, Fund Loan
Pre-Closing QC	2	Credit Refresh, Fraud X Report
Post-Closing QC	14	Deliver Note, Record Mortgage, Deliver Mortgage, Transfer to Cold Storage

How the pieces interact

Every rule follows the same pattern: **something happens on the loan → the rule checks whether it applies → the rule takes action**. Because one rule's action (for example, completing a task) is often another rule's trigger, the rules chain together into an end-to-end process without relying on staff to remember the next step.

1. Something happens	2. Rule checks conditions	3. Rule takes action
A loan field changes, a document is attached, a milestone or task is completed, a timer expires, a loan is created	Loan program, lien position, channel, dates, prior decisions — only applicable loans are affected	Create or complete tasks/subtasks, send notices and disclosures, assign roles, set fields, start or stop timers

What the rules do, by action (counts are individual actions across all rules):

Action	Count	Action	Count
Create a task	95	Update condition tracking	24
Complete a task	68	Add an underwriting condition	23
Add a subtask	63	Start a deadline timer	19
Complete a subtask	53	Cancel a timer	12
Send an internal notification	50	Place a vendor order	10
Assign a role	41	Move loan folder	7
Request a document	29	Send a disclosure package	4
Update a loan field	27		

Why this supports a compliant file

- **Consistency.** Every loan of a given type receives the same tasks and checklist. Required steps are created automatically, not from memory.
- **Required notices are triggered by events.** Rules tie disclosures and adverse-action letters to the events that require them (application, denial, counteroffer, withdrawal, incomplete application, initial Closing Disclosure).
- **Deadlines are enforced by timers.** For example, Notice of Incomplete and Counteroffer each have a warning timer and a closure timer; approvals have an expiration timer; funding and closing have their own clocks.
- **Segregation of duties.** Tasks are assigned to roles (processor, underwriter, closer, funder, QC), and key decisions such as denials use a two-step review.
- **Checks before and after closing.** Pre-closing QC (credit refresh, fraud report) and post-closing QC (document receipt, note/mortgage delivery, recording, HMDA transfer, cold storage) are part of the same workflow.
- **Audit trail.** Encompass records who completed each task and subtask and when. The template and rule library itself is version-controlled, with every change dated and attributable.

Example end-to-end scenarios

These are traced directly from the live rules and are available as an interactive map for staff:

Scenario	What the workflow does
A loan is denied	Two-step denial review leads to the send-denial task, adverse-action notices and cancellation of vendor orders.
A counteroffer is made	Counteroffer review, send, disclosure and the warning/closure timers.
A counteroffer is accepted, declined or runs out	What happens when the counteroffer timer fires or staff record the borrower's answer.
An appraisal is ordered and received	From order task through vendor order, invoice, receipt and underwriting appraisal review.
An appraisal is cancelled and refunded	Cancellation creates the refund task; shows how denial and withdrawal feed it.
Flood certificate ordered and reviewed	Flood order, review, address mismatch, flood-zone conditions and recheck.
Funding and wire	Funding request and approval, wire request and approval, then the fund-loan timer and boarding.
A loan is withdrawn	Withdrawal task, cancellation of title/PAR/flood, folder move and withdrawal letter.
Notice of Incomplete	Incomplete-application notice, warning and closure timers, then cleanup of vendor orders.
Closing documents received and cold storage	Post-closing document receipt, note/mortgage delivery, recording and transfer to cold storage.

How we keep it accurate

- Rules are exported from Encompass and parsed automatically; a cross-reference check flags any rule that points at a task or subtask that does not exist, so broken links are caught before they cause a missed step.
- A reconciliation report compares the task library against what is configured in Encompass and lists every difference for a documented decision.
- Remaining work: 7 of 85 tasks are still being built, and the cross-reference and reconciliation reports currently list open items that are being worked through. This is an ongoing, tracked program rather than a one-time setup.
